

## GORILLA AND MAN

The skulls are totally different, and so are the neck bones, remainder of the spines, and the ribs. The upright stance of the human requires a doubly curved spinal column and a large gluteus maximus muscle. The junction of the spinal cord and the skull is farther forward on the human, so the head can balance in an upright position. Note the massive gorilla jaw and heavy bony crest at the top of the skull, needed for anchoring the jaw muscles.
